

When are the best times to administer diagnostic tests in order to maximize student score improvement?

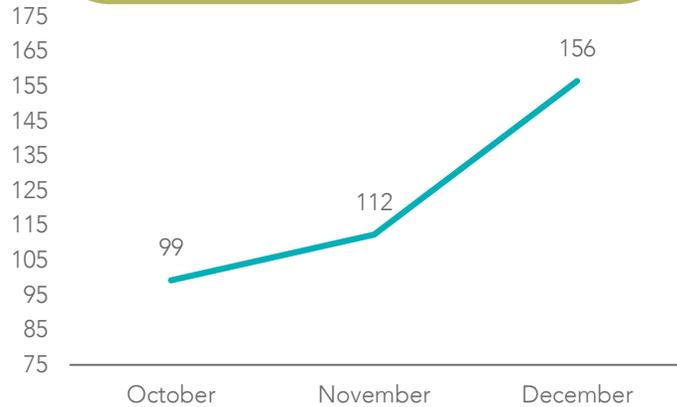

Test 1 Window

As seen in the graph on the left, the ideal test 1 window is in August. Likely, this is because test 1 testing at the beginning of the school year allows for the most growth from baseline in subsequent months but also keeps students engaged with their score growth.

Test 2 Window

As seen in the graph on the right, the ideal test 2 window is in December. Students who tested earlier in October or November did not have had as much time as those testing in December to benefit from further instruction. There were not many students who tested beyond December, so it is not possible to know if delaying testing even further would have been beneficial. Likely, the interference with the test 3 timing would not be worth the tradeoff.

Test 3 Window

As seen in the graph on the left, the ideal test 3 window is around February or March, though testing in January is acceptable, as well.

Test 4 Window

When accounting for the windows for tests 1 – 3, the test 4 window was not related to score improvement, indicating that scheduling test 4 is significantly more flexible than tests 1 – 3.
